

AI Persona Debate: The Impact of AI on Job Creation in Emerging Markets

Part 1: Persona Design Using the ROLE Framework

[Persona A: Victoria Chen – Global Technology CEO](#)

Role

CEO of a multinational AI software company headquartered in Silicon Valley.

Backstory

Victoria spent two decades building technology companies across North America, Europe, and Asia. She advises governments and multinational corporations on digital transformation and AI adoption. She views technology as the primary driver of economic growth.

Communication Style

Formal and analytical

Uses data-driven arguments

Focuses on long-term trends

Speaks confidently and strategically

Values

Innovation

Economic growth

Global competitiveness

Efficiency and scalability

Continuous learning

Vocabulary

Leverage, productivity, innovation ecosystem, scalability, workforce transformation, digital infrastructure, competitive advantage, market expansion, talent pipeline.

[Persona B: David Mwangi – Nairobi Startup Founder](#)

Role

Founder of a small technology and logistics startup based in Nairobi.

Backstory

David started his business after witnessing unemployment challenges among young people in his community. He works closely with local businesses, gig workers, and recent graduates. His perspective is shaped by practical realities such as infrastructure gaps, skills shortages, and access to capital.

Communication Style

Conversational and relatable

Uses real-world examples
Focuses on everyday impacts
Pragmatic and community-oriented

Values

Inclusive growth
Local opportunity
Community empowerment
Job accessibility
Sustainable development

Vocabulary

Community, hustle, practical solutions, local talent, livelihoods, small businesses, opportunity gaps, everyday workers, grassroots innovation.

Part 2: Five-Round Debate

Topic: The Impact of AI on Job Creation in Emerging Markets

Round 1

Victoria Chen

AI will ultimately create more jobs than it eliminates in emerging markets. History shows that technological revolutions increase productivity, which drives economic growth and creates entirely new industries. Emerging markets can leapfrog traditional development stages by adopting AI-powered tools in healthcare, agriculture, education, and finance. The key opportunity lies in building a workforce capable of participating in this transformation.

David Mwangi

I agree that AI creates opportunities, but the reality on the ground is more complicated. Many workers in emerging markets depend on routine jobs that are vulnerable to automation. If AI replaces customer service agents, data entry clerks, or basic administrative roles faster than new jobs appear, communities could face significant short-term hardship. We need to focus on how people transition, not just on the opportunities that might exist later.

Round 2

Victoria Chen

David raises an important concern about transitions. However, delaying AI adoption would be even more damaging. Companies that resist automation become less competitive, limiting economic growth and reducing future employment opportunities. Instead, governments and businesses should invest aggressively in digital skills programs so workers can move into higher-value roles created by AI ecosystems.

David Mwangi

Training programs are important, but many workers cannot simply become AI specialists overnight. A young graduate in Nairobi or Lagos may have talent but lack reliable internet

access, mentorship, or affordable training. We must acknowledge these barriers. Job creation strategies should include support for small businesses and entrepreneurs who can use AI as a tool rather than treating everyone as future AI engineers.

Round 3

Victoria Chen

That's a fair point. In fact, AI's greatest contribution may be enabling entrepreneurship. Small businesses can now access capabilities once reserved for large corporations, including customer support automation, market analysis, and content creation. This lowers barriers to entry and allows local entrepreneurs to compete globally. AI is becoming an economic multiplier.

David Mwangi

I agree that AI can empower entrepreneurs. My concern is who captures the value. If most AI platforms are owned by foreign companies, local economies may become dependent on external technology providers. We should encourage local innovation ecosystems, regional AI startups, and community-based solutions so economic benefits remain within emerging markets rather than flowing outward.

Round 4

Victoria Chen

Local innovation is valuable, but global platforms also provide access to world-class technology that would otherwise require enormous investment. Collaboration between international firms and local businesses can accelerate development. The objective should not be technological independence but strategic integration into the global digital economy.

David Mwangi

Strategic integration sounds good in theory, but local priorities often differ from global priorities. AI solutions designed in wealthy countries may not fully address local challenges such as informal employment, agricultural inefficiencies, or language diversity. Emerging markets need a seat at the table when technologies are developed. Otherwise, job creation may not align with community needs.

Round 5

Victoria Chen

The future workforce will increasingly collaborate with AI rather than compete against it. Emerging markets that invest in education, infrastructure, and innovation-friendly policies can become major beneficiaries of this shift. The long-term evidence suggests that technology expands economic opportunity when institutions adapt effectively.

David Mwangi

I believe AI can create jobs, but success depends on inclusion. Growth statistics mean little if ordinary workers are left behind. Policymakers, educators, and business leaders must ensure that AI adoption creates accessible pathways to employment, entrepreneurship, and income generation. The question is not whether AI creates jobs—it is who gets access to those jobs.

Part 3: Summary Analysis

Which Persona Was More Convincing?

David Mwangi was slightly more convincing because he balanced optimism with practical concerns. While Victoria presented strong strategic arguments, David grounded the discussion in the lived realities of workers and small businesses. His examples made the debate feel more relevant and actionable.

Why?

Victoria focused on macroeconomic outcomes such as productivity, competitiveness, and long-term growth. These arguments were logically sound but somewhat abstract.

David focused on implementation challenges, including:

- Skills gaps
- Infrastructure limitations
- Access to technology
- Local ownership of innovation
- Inclusive economic participation

Because these issues directly affect whether job creation actually occurs, his arguments felt more immediately persuasive.

How Did Framing Affect Quality?

The personas significantly changed the debate's quality.

CEO Framing

Produced:

- Strategic thinking
- Global perspective
- Long-term analysis
- Economic and business-oriented reasoning

Entrepreneur Framing

Produced:

- Human-centered insights
- Practical examples

Local context

Focus on execution challenges

The contrast demonstrates how persona design shapes AI output. The CEO emphasized scale and growth, while the entrepreneur emphasized accessibility and real-world impact. Together, the two perspectives created a richer and more balanced discussion than either persona could have produced alone.

Key Lesson

Well-defined personas influence not only tone and vocabulary but also priorities, assumptions, and reasoning patterns. Using structured frameworks such as ROLE and CREATE helps generate more realistic, nuanced, and context-aware AI outputs.
